

Ask in plain English. It answers, plans — and proves.

Ryekronix plans the investigation, runs real tools on your live plant data, validates against physics and standards, and asks a human before any action.

WHAT IT DOES

- **Not a chatbot:** it plans a task, executes tools, observes results and revises — and shows every step with a confidence.
- **Only two action types exist:** dispatch a work order, or trigger a model retrain. Neither happens without six checks (role, policy, payload, physics limits, blast radius, duplicate) and a human approval.
- **Refusals are logged:** a failed check stops the action, states the reason, and records it — a person decides what happens next.
- **Six surfaces, one agent:** Console, Approvals, Design Studio, Quick What-if, Objectives, Learning.
- **Runs on your hardware** against your live data, knowledge base and standards; nothing leaves the site.

MEASURED, NOT DESCRIBED — EVERY FIGURE CARRIES ITS STATUS
